ANCHOR CHAIRS

Anchor chairs are a tie-down option. They are welded to a tank near ground level and get bolted to the concrete. They are used to stablize a tank for wind and seismic actions.

Anchor chairs are more often used on steel or fiberglass storage tanks but we can also outfit our tanks with them. They are available for our Polyethylene (HDPE), PVDF and Polypropylene tanks.

We normally outfit our tanks with four Anchor Chairs but we can add more if requested. Larger tanks like 10000 gallon tank may have six or eight.

Our tanks are also equipped to accept wind/seismic tie-down cable and anchor systems.
