# TOP FILL LINE

A ‘Top Fill Line’ is the preferred option for chemical delivery from a truck. It allows a delivery truck to easily connect with a hose, and fill the tank.

No added sidewall penetration is required since the Top Fill Line connects through the dome of the tank. This is of extra advantage on a double wall tank.

The fill line is equipped with a Ball Valve for liquid flow control and a Check Valve for safety. A version for non-hazardous liquids is available without the Check Valve. A tube is optionally available. An Anti-Foam bend is optionally available to direct fluid down the side of the tank.

Welded Pipe supports are used to support the Top Fill Line. No wall penetrations are needed for these braces.
